Power loss values and temperature performance

MDC 45 - 60 - 100 compact residual current circuit breakers with overcurrent protection

Technical characteristics

For circuit overcurrent protection and the residual current protection of devices and services, there are the MDC 45, MDC 60 and MDC 100 compact residual current circuit breakers with overcurrent protection.

The MDC compact miniature circuit breakers with residual current release have a thermomagnetic part with the same characteristics as the MTC circuit breakers. The residual current release - assembled in the factory inside the same modular shell - is available in AC, A, A[IR] impulse resistant and A[S] selective versions with a rated residual current of 30, 100 and 300 mA.

Some advice about selection and installation

One of the most common problems when installing residual current circuit breakers is the untimely tripping caused by earth leakage which is not due to real faults.

The most frequent causes are:

- services with electronic devices such as computers, hi-fi systems and household appliances in general, which are fitted with anti-interference capacity filters
- capacity effects of the electrical lines of the system which have a high capacity towards earth, especially if they are widely extended.

In these cases, the capacity effect leads to the generation of a residual current leakage, causing the circuit breaker to trip. The intensity of this current increases above all when there are surges of voltage in the mains due to atmospheric disturbance, or transitory interference caused by the services. At the time of switch-off, fluorescent lamps equipped with a ballast are typical generators of such interference, which can be removed by introducing small capacities in parallel. All residual current circuit breakers are equipped with anti-interference devices.

In the presence of electronic equipment which can generate one-way runaway currents, it is essential to install A-type residual current circuit breakers.

MDC temperature performance

BD - BDHP add-on for miniature circuit breaker

Add-on for MT (BD) and MTHP (BDHP) miniature circuit breakers, which can be coupled by the installer once only (in compliance with Standard CEI EN 61009, appendix G). AC, A, A[IR] impulse resistant, A[S] selective and adjustable types are available.

MODULAR DEVICES FOR RESIDUAL CURRENT PROTECTION

IDP residual current circuit breakers

TECHNICAL CHARACTERISTICS

Two-pole and four-pole residual current circuit breakers without built-in overcurrent releases - free release monobloc.

AC class devices with instantaneous tripping are available (for residual sinusoidal alternating currents only), whereas A class residual current circuit breakers (suitable for residual one-way pulsating currents with a direct component) are available in instantaneous, impulse-resistant and selective versions.

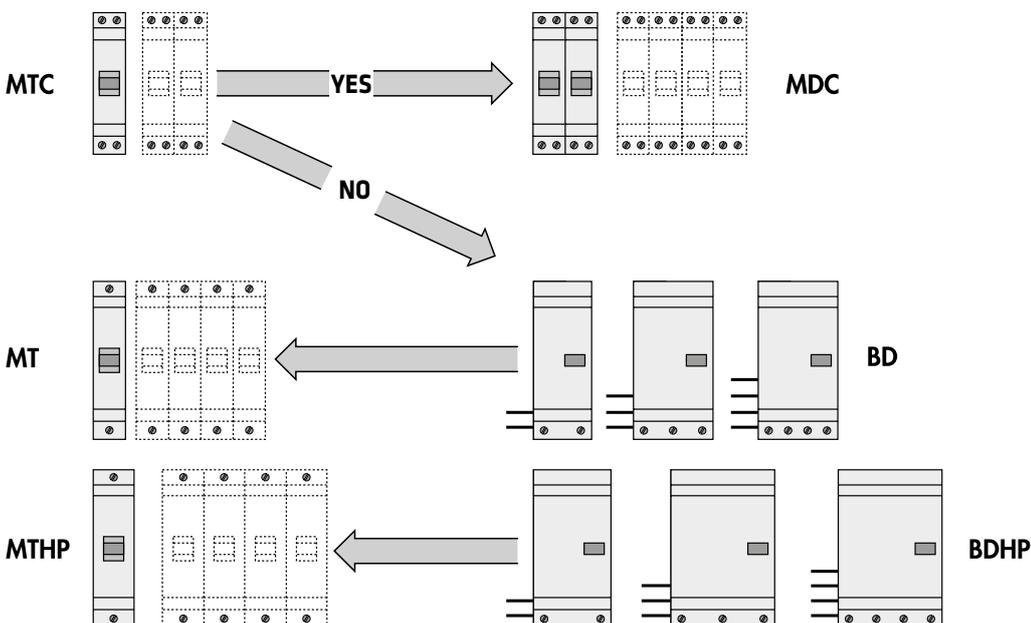

Moreover B class residual current circuit breakers in instantaneous and selective versions are available for the protection of electrical loads which can create fault currents with a direct component in case of earth leakage.

Composition rules for the modular residual current circuit breakers

In order to obtain a residual current circuit breaker from a miniature circuit breaker, it is necessary to observe these rules:

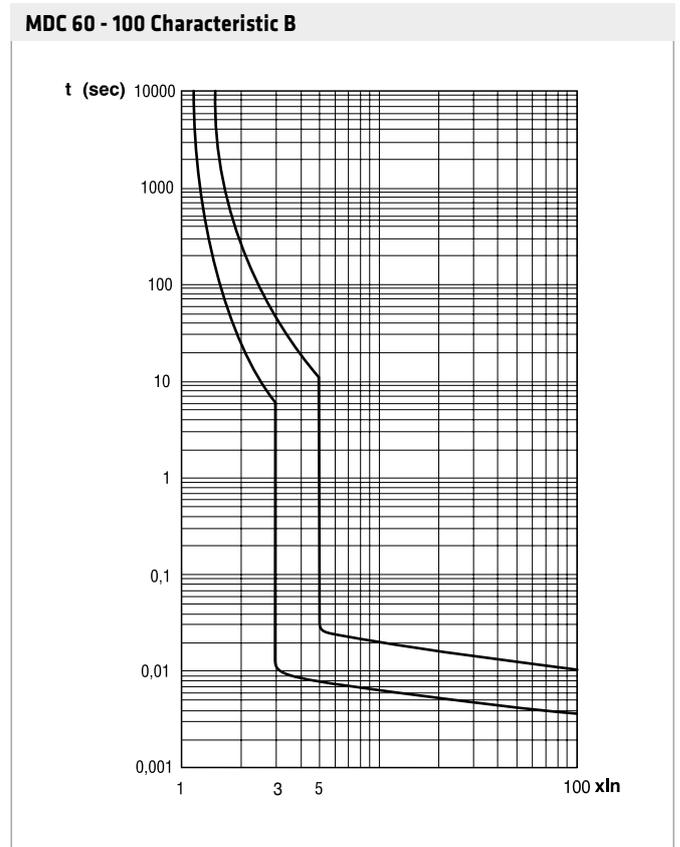

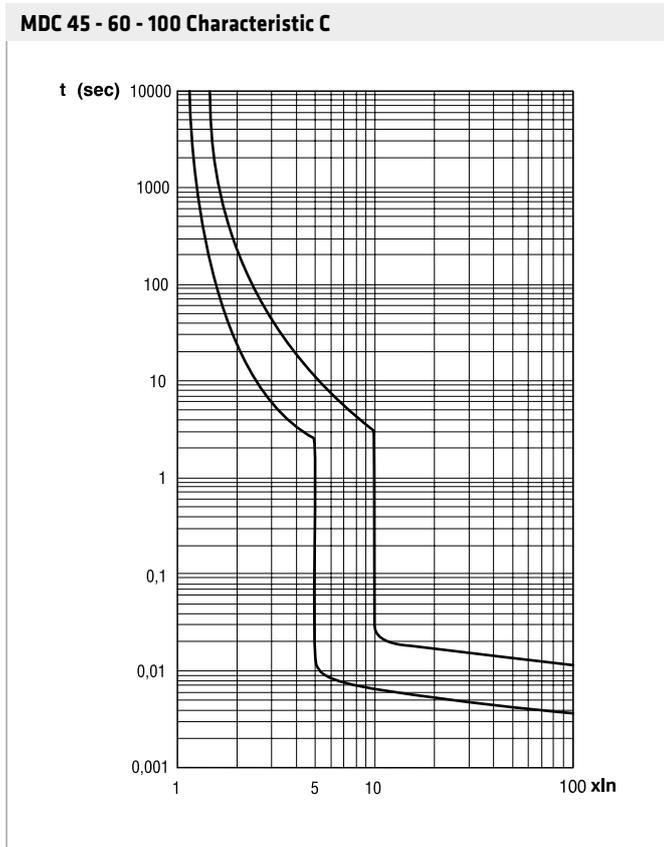

- 1 - there is no residual current device that can be associated with the MTC circuit breakers. There is the MDC compact monobloc residual current circuit breaker with overcurrent protection.
- 2 - the BD add-on residual current device can only be associated with the MT circuit breakers.
- 3 - the BDHP add-on residual current device can only be associated with the MTHP circuit breakers.
